Microsoft Enterprise Desktop Virtualization is a virtualization software solution which delivers a virtual PC desktop inside a Virtual Machine (VM). A user works in the virtual desktop just as in a real machine, but the underlying physical hardware remains the same. By deploying VPC inside the Virtual Machine, MED-V extends the life of physical hardware while providing the user with a desktop and a real Windows interface. In addition, by using Shared VMs (see example below), users do not need to install and maintain individual virtual desktops for each user. The key features of the Microsoft Enterprise Desktop Virtualization solution are: · Smooth user experience - users can boot a Desktop and run their favorite applications just as they would if they had physical access to the desktop. · Legacy application support - work with old applications, versions or platforms because they all run in a virtual desktop as if it were a real physical machine. · Running local installations - leveraging Microsoft Virtual PC and using Remote Desktop Connection, users can also run native applications from physical computers on a local network. · Zero application deployment time - the virtual desktop image can be created as a package, or a scripting solution can be used to create a binary executable installer, and then deployed on an entire environment. · Workspace-based deployment - multiple Workspaces can be installed on a single host, and configured to run simultaneously. Workspaces can be easily managed from a central console, and be scaled up or down to meet the workload. · Share-based deployment - the target virtual machine is a shared file server, which allows two or more users to use the same virtual desktop instead of having to install virtual machines on each user's machine. Features of MED-V · Designed to run a Virtual PC environment with Virtual machines operating on top of it - a virtual computer environment where multiple operating systems can run side by side. · Runs as a standard Windows user interface desktop session - a virtual desktop within a Virtual Machine which runs just as if it were a real physical machine. It works exactly like Windows 7. · Supports both legacy applications and new operating systems - can be used on any Windows operating system. VPC is not affected by Windows update. · Can run both native and legacy applications - applications that can run on Windows XP or Windows 2000 or Windows 7 can be run in MED-V. · Can be managed from a command line or an interactive desktop - administrators can create and deploy Virtual Machine images, manage the Microsoft Virtual Machine Manager console, or work interact
